

Anti-Phishing Solution: The Real Time Protection

Phishing is the preferred technique to compromise corporate IT. According to Verizon, at least 91% of IT breaches involved phishing in year 2015.

Users are unable to differentiate legitimate emails from fraudulent ones, phishing has become a trend.

Vade Secure's Anti-Phishing solution **combines an individual behavioral email analysis with a real time links exploration at the Time-Of-Click** to ensure an overall safety of the messaging system.

SECURITY BEFORE, DURING, AND AFTER THE ATTACK

Eliminate the threat **before** it arrives

This technology identifies threats from the first email in zero-day. The filter operates a behavioral analysis of each email, including the header, attached files, links and structure. This step recognizes most phishing patterns and quickly eliminate the threat even on low volume waves.

Explore links **during** the wave

Links are explored during the filtering process to determinate the harmlessness of the webpage. Vade Secure's exploration engine is based on heuristic technology coupled with machine learning that detects fake pages aimed at deceiving users.

Double check **after** the email is received

Links are explored during the filtering process to determinate the harmlessness of the webpage. Vade Secure's exploration engine is based on heuristic technology coupled with machine learning that detects fake pages aimed at deceiving users.

REAL TIME PHISHING PROTECTION

The most comprehensive Anti-Phishing solution on the market. With the rise in phishing attacks in both volume and sophistication, users are unable to recognize most advanced phishing emails.

With Vade Secure's Anti-Phishing solution, **your users are protected at the most critical step:** at the time-of-click.

BRAND & HOST ALERT: A TEAMWORK
