

# Anti Spear Phishing Solution

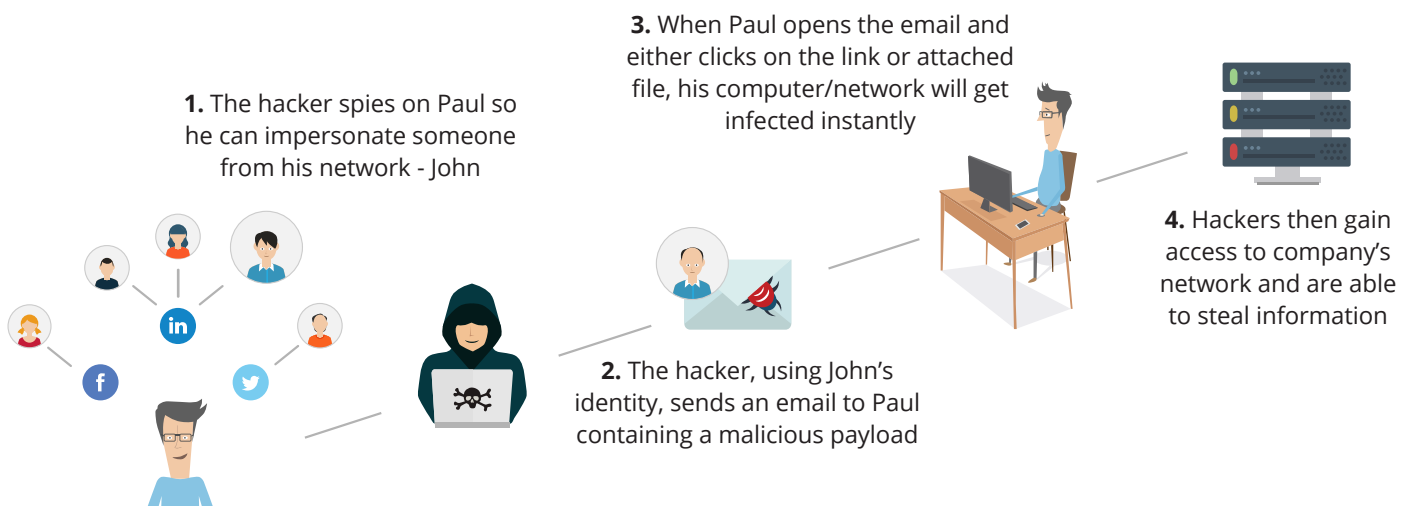

## Be protected from targeted attacks!

Spear phishing emails, also called CEO Fraud, aim at hijacking a known person or an organization to deceive its recipients.

Hackers who employ Spear Phishing often know the target recipient's name, address, job title, and professional network. The spear phisher already knows a lot about his intended victim thanks to the vast amount of personal information that can be accessed online via social networks, media, etc.

## A COMBINATION OF CONTENT AND CONTEXTUAL HABIT ANALYSIS

Vade Secure actively fights Spear Phishing with cutting edge technology dedicated to identify this specific and targeted threat. The filtering process uses two technologies: Identity Match and the Content Inspection.

### Advanced spoofing detection: Identity Match

Identity Match is a set of protection developed and patented by Vade Secure. It identifies every email that is spoofing your company domain name, alias and even similar email addresses based on communication habits. The solution identifies similarities between new senders and all your previous contacts in order to identify if there is a spoofing attempt targeting your company.

### Sensitive data protection: Content Inspection

Vade Secure uses a smart and fully integrated banner to alert users regardless of the device used when sensitive data is requested in the message. Your users are aware of the incoming threat while your email administrator receives an alert to be able to react quickly in a case of a breach.

## THE CHALLENGE FOR EMAIL SECURITY VENDORS

Though they are only a very small part of the world's total email volume, **Spear Phishing attacks are highly targeted and, therefore, effective.** As a result, anti-spam technology must include content inspection to effectively combat these threats.

”

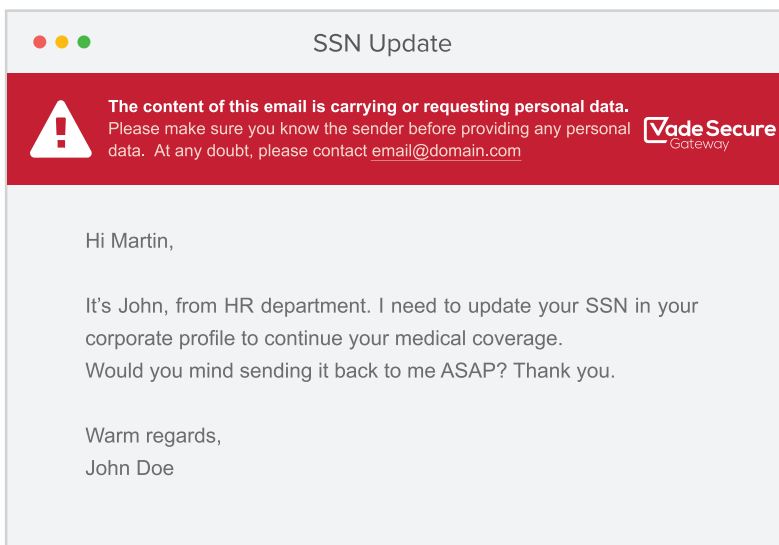

**Peter Firstbrook, an Analyst at Gartner**, concluded in the most recent Magic Quadrant: *“Vendors that specialize in content inspection will be more successful in detecting these types of attacks than those that rely on reputation.”*

”

### One attack, many purposes

Hackers can either use spear phishing to steal your employees' sensitive information (social security number, bank credential...) or, their objective can be to gain access to your company's network through a malware injection. Once they are in the network, they are free to wire money abroad, copy your customer list, patents and more.

VadeSecure's solution aims at preventing this by analyzing and understanding both content and payload.

### A Business Model that is 100% Scalable

Our anti spear phishing solution is **available either as a plugin or as part of a global email filtering solution.** Both in the cloud or on site through a virtual appliance.
